Converting a long double to unsigned int I want to convert a long double to an unsigned int, however I want the conversion to be exactly and round-off free (i.e. no loss of precision). I know that long double normally have 53bits of precision, so I can't understand why the following isn't exactly representable in an unsigned int. template T convert(long double in) { //define infinity and NaN float infinity = INFINITY; double NaN = NAN; //check for infinity and NaN, then store in. T out = in; out = (in!=

---

infinity && in!= NaN)? (T)in : out;  
return out; } The cast is necessary as  
(T)in has type long double and  
cannot be used with an unsigned int.  
I have tried casting to long long and  
converting to an unsigned int, but I  
am getting the same result. I have  
also tried an explicit conversion, but  
it appears to still lose precision. A: If  
it is an IEEE754-2008 double (or a  
double-extended-binary number),  
then, yes, it is wrong. If the actual  
double is an IEEE754-1985 double  
(or any other double that has  
different numbers of decimal digits  
than long double), then you should

fine. Conversion to an unsigned int is done by ignoring bits 63, 62,..., 52, leading to an IEEE754-1985 double. The conversion you have written would convert to the wrong value unless the original long double is a special value: long double d = 0.1; unsigned int u = (unsigned int) d; cout The present invention relates to a new and distinctive soybean cultivar, designated 3247820.
